

ABSTRACT

It is intended to provide an inhibitor for the formation of a γ -secretase complex which comprises a cholesterol synthesis inhibitor or a protein
5 geranylgeranylation regulator as the active ingredient; and use of a cholesterol synthesis inhibitor or a protein geranylgeranylation regulator for producing the same. It is also intended to provide a method of screening a substance having an effect of inhibiting the formation of an active complex of γ -secretase which comprises assaying the activity of inhibiting cholesterol synthesis or
10 quantifying cholesterol accumulated in lipid rafts in cells. It is also intended to provide a method of screening a cholesterol synthesis inhibitor, a protein geranylgeranylation regulator or an HMG-CoA reductase inhibitor which comprises assaying the effect of inhibiting the formation of an active complex of γ -secretase. Moreover, it is intended to provide a method of screening an
15 effect of a test substance on γ -secretase which comprises measuring the distribution of constituents (niscastatin, APH-1, Pen-2 and so on) required by γ -secretase for the formation of its active complex in cells.
